Types of Boiler Heating

Combi or Combination Boiler Heating

- Combi boilers provide heating and hot water directly from the boiler.
- Combi boilers provide maximum pressure through only one tap at a time.

Plumbing, Heating and Air Conditioning, Inc.

Regular or Conventional Boiler

- **Regular** boilers heat your central heating system directly and produce hot water for your **cylinder**.

Plumbing, Heating and Air Conditioning, Inc.

System Boiler

- A system boiler can provide central heating and hot water from a cylinder if required.

Back Boilers

- Back boilers can be fuelled by gas, oil or solid fuel. All require a lined, natural-draught open flue to expel the potentially harmful gases.

Condensing Boilers

- A condensing boiler uses modern technology to maximize the fuel efficiency of either a conventional or combination system.
- It is known as a condensing boiler because the water from these flue gases 'condenses' in the secondary heat exchanger and drains away at the bottom of the boiler.

Storage Tanks

- Boilers with a storage tank (hot water cylinder) are better capable of coping with the demands of multiple use and can deliver water at a high temperature and at a high flow rate. Unvented tanks allow main pressure water delivery, rather than relying on gravity as traditional open vented systems do.
